## Answers to Engineering Proteins End of Unit Test

| Q | Answer with marks | Marking suggestions |
| :---: | :---: | :---: |
| 1(a) | COOH and $\mathrm{NH}_{2}$ attached to same C (1) |  |
| 1(b) (i) |  |  |
| 1(b) (ii) |  <br> Formation of this ion removes $\mathrm{H}^{+}(1)$ from solution (1) |  |
| 1(c) (i) | Optical isomerism (1) |  |
| 1(c) (ii) | Two 3-dimensional structures (1) shown as object and mirror image (1), eg mirror |  |
| 1(d) (i) |  <br> (1) |  |
| 1(d) (ii) | Ring round CONH on one structure (1) |  |
| 1(d) (iii) | Reflux (1); with moderately concentrated (1) acid (1) |  |

| Q | Answer with marks | Marking suggestions |
| :---: | :---: | :---: |
| 2(a) (i) | The order of the amino acid (residues) (1) |  |
| 2(a) (ii) | Folding of the chain into a helix (1) or sheet (1) |  |
| 2(b) |  <br> (1) for correct hydrogen bond <br> (1) for charges related to hydrogen bond <br> (1) for other charges | Ignore bond angles in diagram |
| 2(c) (i) | The folding of a protein's chain gives it the right shape (1); it controls the shape of the active site into which the substrate fits (1) | Allow 'lock and key' for second mark or availability of reactive groups in active site to bind the substrate |
| 2(c) (ii) | On heating, weak intermolecular forces such as hydrogen bonds are broken (1); thus the protein loses its tertiary structure (1) |  |
| 2(c) (iii) | COOH turned to $\mathrm{COO}^{-}$on raising pH or on lowering $\mathrm{pH},-\stackrel{+}{\mathrm{N}} \mathrm{H}_{3}$ formed (1); the changes affect binding of substrate (1) |  |

| Q | Answer with marks | Marking suggestions |
| :---: | :--- | :--- |
| 3(a) (i) | Titrate/measure acid present (1); the increase in acidity is related to <br> the amount of DIMP formed (1) |  |
| 3(a) (ii) | Three values in range 280-320 s (1) <br> Working for all three shown on graph (2) | Working for one scores (1) |
| 3(a) (iii) | First order (1) <br> Constant half-lives (1) |  |
| 3(b) | Rate $=k\left[\mathrm{H}^{+}\right][$DIMP] <br> (1) for $\left[\mathrm{H}^{+}\right][D I M P]$ <br> (1) for equation completely correct |  |

| Q | Answer with marks | Marking suggestions |
| :---: | :---: | :---: |
| 4(a) (i) | Sixth (1) |  |
| 4(a) (ii) | Glu/glutamic acid (1) |  |
| 4(b) (i) | (1) for sugar-phosphate backbones <br> (1) for bases attached to sugar <br> (1) for bases on two chains adjacent |  |
| 4(b) (ii) | Hydrogen bonds (1); dotted lines on diagram (1) |  |
| 4(c) (i) | A gene (or DNA segment) which makes HbA would have to be taken from another organism (1); and placed in the cells of a patient with the disease (1) |  |
| 4(c) (ii) | Advantage (1), eg curing genetic disease, making crops resistant to pests/pesticides, making cheaper medicines, etc Disadvantage (1), eg effects unknown, pests resistant to all pesticides, etc |  |

| Q | Answer with marks | Marking suggestions |
| :--- | :--- | :--- |
| 5(a) (i) | $K_{\mathrm{c}}=\frac{\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right]}{\left[\mathrm{C}_{2} \mathrm{H}_{4}\right]\left[\mathrm{H}_{2} \mathrm{O}\right]}$ <br> (1) for top line; (1) for bottom line |  |
| 5(a) (ii) | $\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right]=\mathrm{K}_{\mathrm{c}} \times\left[\mathrm{C}_{2} \mathrm{H}_{4}\right]\left[\mathrm{H}_{2} \mathrm{O}\right]=24 \times 0.45 \times 0.05(1) ;$ <br> $=0.54$ mol dm-3 (1) for number - with error carried forward; <br> (1) for units (no ecf) and $2 / 3$ sf. |  |
| 5(b) (i) | smaller (1); increasing the temperature makes equilibrium move <br> in endothermic direction (1); by Le Chatelier's principle/ because it <br> moves to oppose the change (1) |  |
| 5(b) (ii) | 1. no effect (1) <br> 2. more ethanol (1); or equilibrium moves in direction of <br> fewer molecules (1) |  |
| 5(b) (iii) | It is not economical because running costs/capital costs too high/need <br> thick-walled vessels/it is dangerous (1) |  |
| 5(c) | Ethanol (1); <br> Three types of proton (1) |  |
